Day2-PM

Day 2 of my PM journey: business models, product development lifecycle, types of PM, user types, personas, PRD and MVP.

1. Types of Business Models

Based on service

Model	Full form	Meaning	Example
SaaS	Software as a Service	Ready-to-use software	Netflix
IaaS	Infrastructure as a Service	Virtual servers	AWS EC2
PaaS	Platform as a Service	Platform for developers to deploy apps	AWS Elastic Beanstalk

Based on target customer (B2C vs B2B)

Model	Meaning	Example
B2C	Business to Consumer	Zomato
B2B	Business to Business	Zoho

Based on how the company works

Model	Full form	Meaning	Example
ISV	Independent Software Vendor	Builds and sells its own software	Adobe, Microsoft
MSP	Managed Service Provider	Manages infrastructure for clients for a monthly fee	Ensono
SI	System Integrator	Integrates hardware and software for projects	TCS, Wipro
VAR	Value Added Reseller	Resells products with added services	Local Dell partner

2. Product Development Lifecycle

Idea → Research → Design → Development → Testing → Launch → Maintenance

Benefits:

- Lower risk
- Saves time and money
- Customer focus
- Long-term management
- Better quality focus

3. Types of PM

- **Startup:** Generalist (handles many things)
- **MNC / Enterprise:** Specialist (focuses on one area)

4. Types of Users (Adoption Curve)

1. Innovators
2. Early adopters
3. Early majority
4. Late majority
5. Laggards

5. User Personas

A user persona is a specific profile that represents your target audience.

Why it matters:

- Drives clarity and alignment
- Builds empathy
- Helps with prioritisation

Types (example: a game for a child):

Type	Role	Example
Buyer	Decides to buy	A mother deciding to buy the game for her child
Customer	Pays	A father paying for it

Type	Role	Example
User	Uses the product	The child playing the game

6. PRD (Product Requirement Document)

A PRD explains **why** we are building something, **what** we are building, and **how** we will succeed. It helps with prioritisation and reduces ambiguity.

A PRD must have:

1. Context and background
2. Target users: user personas and use cases
3. Goals
4. Features and requirements
5. User expectations and flows
6. Edge cases and exceptions
7. Metrics and success criteria
8. Timeline (versions) and dependencies

7. MVP (Minimum Viable Product)

The simplest version of a product, built to validate an idea and collect feedback.

Questions it answers:

- Is my problem worth solving?
- Am I solving it in the right direction?
